## I ntroduction

Math is everywhere and yet we may not recognize it because it doesn't look like the math we did in school. Math in the world around us sometimes seems invisible. But math is present in our world all the time - in the workplace, in our homes, and in our personal lives.

You are using math every time you go to the bank, buy something on sale, calculate your wages, calculate GST or a tip.

Money Math is one workbook of the Everyday Math Skills series. The other workbooks are:

- Kitchen Math
- Home Math

We have also developed a math skills booklet called Simply Math to help learners with different math operations that are needed for this series.

Money Math has three sections. Each section has a variety of topics and worksheets and a review page. The workbook is designed so that you can work on your own or with others in your class.

## Section One: Personal Finances

This section gives you an opportunity to reflect on your personal finances. You learn to look at your expenses and set up a budget. You consider where you might cut expenses in your daily living. You also learn how to calculate weekly, monthly and yearly wages and how federal and NWT tax works.

Introduction

## Section Two: Saving Money

In this section you learn about simple and compound interest, saving for retirement and return on investment. When you invest money over a long period of time you can make a substantial amount of money. Even if you just invest $\$ 50$ a month - you can make thousands upon thousands over the long haul. Learn how compound interest works in your favour and how you can be ready for retirement.

## Section Three: Consumer Math

In this section you learn about spending money! How much should you tip? What does it cost to go on a vacation? How much do you really pay when you take out a personal loan? You will also learn how to calculate discounts on merchandise, figure out gas consumption and sort through cell phone options.

The math skills are embedded into real-life situations and activities. In this workbook you will use the following skills:

- Addition and subtraction
- Multiplication and division
- Order of operations
- Rounding off
- Estimation
- Follow formulas
- Graphing
- Interest
- Fractions
- Decimals
- Percents
- Metric measurement
- Metric conversions
- Exponents
- Problem solving

## Personal Finances

This section has activities about personal finances from budgeting to calculating the federal and NWT tax that is taken off pay cheques. In this section you will be required to use a variety of math skills:

- Addition
- Subtraction
- Multiplication
- Division
- Order of operations
- Percent
- Graphing
- Problem solving

This section has the following worksheets:

- Worksheet \#1: Making a Budget
- Worksheet \#2: A Budget at a Glance
- Worksheet \#3: Your Budget at a Glance
- Worksheet \#4: Cutting Expenses
- Worksheet \#5: Time Cards
- Worksheet \#6: Earnings Statement
- Worksheet \#7: Calculating Gross Weekly Wages
- Worksheet \#8: More on Wages
- Worksheet \#9: Paying Income Tax
- Worksheet \#10: Cashing Cheques
- Worksheet \#11: Doing Your Taxes
- Worksheet \#12: Personal Finances Review

This section also has a Personal Finances Projects page.

## Making a Budget \# 1

## Addition, subtraction, multiplication

The first step to coming up with a good budget is comparing your income to your expenses. Your income is the amount of money you get on a yearly basis. You may have several sources of income: student loans, education allowance, income support, child support, full-time job, part-time job, etc. Your expenses are everything that you spend money on from rent to coffee.

Look at the example below.

| Source of Income | Monthly | Yearly |
| :--- | :---: | :---: |
| Income Support | $\$ 2450$ | $\$ 29,400$ |
| Part-time job | $\$ 400$ | $\$ 4800$ |
| Child support | $\$ 200$ | $\$ 2400$ |
| Total | $\$ 3050$ | $\$ 36,600$ |

Part 1: Figure out your monthly and yearly income. Fill in the chart below.

| Source of Income | Monthly | Yearly |
| :--- | :--- | :--- |
|  |  |  |
|  |  |  |
|  |  |  |
| Total |  |  |

Part 2: Now it is time to calculate your monthly and yearly spending. You will have two types of spending: fixed and variable. Fixed expenses happen every month. For example, your rent would be a fixed expense. Variable expenses change each month. Try and estimate how much these are on average per month.

| Expenses | Monthly | Yearly |
| :--- | :--- | :--- |
| Housing (mortgage or rent) (fixed) |  |  |
| Utilities (fixed) |  |  |
| Day care (fixed) |  |  |
| Ongoing obligations like child <br> support (fixed) |  |  |
| Telephone |  |  |
| Cell phone |  |  |
| Food |  |  |
| Eating out (coffee, lunch, snacks etc) |  |  |
| Clothing |  |  |
| Home supplies (furnishings, <br> cleaning supplies, etc |  |  |
| Transportation (bus, taxi) |  |  |
| Car loans and maintenance |  |  |
| Vacations |  |  |

## Personal Finances

| Recreation (movies, videos, <br> memberships, sports) |  |  |
| :--- | :--- | :--- |
| Gifts and contributions (charity, <br> church) |  |  |
| Personal expenses (haircuts, pet <br> expenses) |  |  |
| Babysitting |  |  |
| Other |  |  |
| Total Expenses |  |  |

Part 3: Does your spending balance with your income?

Example: Does Mary's spending and income balance?

Problem: Mary takes in $\$ 2550$ per month. She spends $\$ 2680$ per month.

Solution: | Monthly income | $\$ 2550$ |
| :--- | :--- |
|  | Monthly expenses |
|  |  |
| $\mathbf{- \$ 2 6 8 0}$ |  |
| $\$ 180$ |  |

Mary is $\$ 180$ per month over her monthly budget and $\$ 2160$ per year.

## Your Turn!

Total monthly income

- Total monthly expenses
$=\quad$ Total monthly balance

## A Budget at a Glance \#2

Percent, graphing, addition, subtraction
The circle below represents a person's monthly income (\$2500). From the total there are the following expenses; rents costs $\$ 1250$ (including utilities) food amounts to $\$ 500$, transportation is $\$ 100$, clothing comes to $\$ 100$ and other extra expenses are another \$250.

1. What percentage does each item represent? Percentages are used to express how large one quantity is, relative to another quantity. The first one is done for you.

$$
\begin{array}{ll}
\text { a. Rent } & 1250 \div 2500=0.50 \\
& 0.50 \times 100=\underline{\mathbf{5 0} \%}
\end{array}
$$

Personal Finances
b. Food
c. Transportation $\qquad$
d. Clothing
e. Extra expenses $\qquad$
2. How much does this person save each month? $\qquad$ What is the percentage? $\qquad$
3. On the circle shade in each expenses according to their percentage. Use different colours to show each one. Fill the in the key at the side.

## Your Budget at a Glance \#3

## Percent, graphing, addition

Look at your budget and try and put all your expenses into 5-7 categories. For example rent, food, clothing, transportation, daycare, etc. Calculate an amount for each category. Then fill in the circle and the key on the side to represent your budget.

1. What percentage do you pay in rent or mortgage? $\qquad$
2. What percentage do you pay for food? $\qquad$
3. Are you surprised by how much you pay for certain things? $\qquad$
4. Do you have any money left over each month? $\qquad$

Personal Finances

## Cutting Expenses \#4

## Multiplication, addition, subtraction

In the example on Worksheet \#1, Mary spent $\$ 180$ more per month and $\$ 2160$ per year than her budget allowed. How can Mary cut her expenses?

## Example: Mary needs to cut her expenses.

Problem: Mary spends $\$ 2.50$ per day during the week on a coffee. How much would she save if she stopped getting her coffee at the coffee shop?

Solution: $\quad \$ 2.50 \times 5$ days $\times 52$ weeks $=\$ 650$

Mary would save $\$ 650$ per year.

Calculate how much each person would save by cutting back on the following expenses.

1. Michelle pays $\$ 85$ per month for a fitness membership that she rarely uses. How much money can she save in one year if she quits the fitness centre?

2. Lois buys about 3 packs of cigarettes per week. Cigarettes are $\$ 12.50$ per pack. How much money can she save in one year if she quits? $\qquad$
3. Anne goes out to lunch every Friday. On average she spends around $\$ 18$ each time. How much money can she save in one year if she stops going out for lunch each week? $\qquad$
4. Joe buys his son a Gatorade each time his son plays hockey. The Gatorade costs $\$ 2$. His son usually plays 3 times a week for a half year. How much money can Joe save if he brings water from home for his son instead of buying Gatorade?
5. Jackie usually rents at least 4 movies a week. Each movie costs $\$ 5$. How much money would she save in one year if she decided to rent only 2 movies per week?
6. Lisa likes to go to one movie per week. She usually spends $\$ 12$ on her ticket and $\$ 10$ on a drink and popcorn. How much money would she save in one year if she went on Tuesdays when the price of a ticket was
 half off and she didn't have any snacks? $\qquad$
7. Ken really likes his lattes, but they are costing him a fortune. He spends $\$ 5.75$ each work-day for a large latte. Ken works 5 days a week. Ken really needs to cut back on spending so he has decided to only get a small latte at the cost of $\$ 3.75$. How much money will Ken save over the
 course of one year? $\qquad$
8. Alice likes to have wine with her dinner on Friday and Saturday night. She usually buys two bottles of wine for the weekend. She really needs to cut back on spending. She decides to buy only one bottle per week. On average a bottle of wine costs $\$ 15$. How much does she save in one year? $\qquad$
9. Lori often takes a taxi instead of taking the bus. On average she takes 3 taxis a week at a cost of $\$ 25$. The bus would cost her only $\$ 6$ a week. How much money would she save in one week? $\qquad$ One year? $\qquad$
10. What can you cut back on in your life to save money? Choose one thing and calculate how much money you can save. $\qquad$

## Time Cards \#5

## Multiplication, addition

Time cards are filled out by employees. Maximum regular hours (before overtime) are 40.

1. Hannah works in a kitchen and often works split shifts. Fill in the missing amounts on Hannah's time card.

| Time Card |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employee: Hannah |  |  |  |  |  |
| Day | In | Out | In | Out | Total Hours |
| Monday | 6:00 AM | 9:00 AM | 11:00 AM | 1:00 PM |  |
| Tuesday | 7:00 AM | 10:00 AM | 11:00 AM | 4:00 PM |  |
| Wednesday | 6:00 AM | 10:00 AM | 12:00 PM | 3:00 PM |  |
| Thursday | 9:00 AM | 12:00 PM | 3:00 PM | 7:00 PM |  |
| Friday | 10:00 AM | 3:00 PM | 5:00 PM | 9:00 PM |  |
| Saturday | OFF | OFF | OFF | OFF |  |
| Sunday | 6:00 AM | 1:00 PM | 4:00 PM | 6:00 PM |  |
|  |  | HOURS | $\begin{array}{r} \text { SALARY } \\ \text { PER HOUR } \end{array}$ | TOTAL SALARY |  |
| Regular Hours |  |  | \$15.00 |  |  |
| Overtime |  |  | \$22.50 |  |  |
| TOTAL |  |  |  |  |  |

2. If Hannah worked these hours each week, how much would she make in:
a. 2 weeks? $\qquad$
b. 4 weeks?
c. 1 year?
$\qquad$
$\qquad$
3. Hannah usually gets around $\$ 30$ per day in tips from the servers from the restaurant.
a. How much money does she make in tips per week? $\qquad$
b. How much money does she make all together in one week? $\qquad$
c. How much per hour does this work out to be? (round to the nearest cent)
4. David works as a server at a restaurant and often works split shifts. Fill in the missing amounts on David's time card.

| Time Card |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employee: David |  |  |  |  |  |
| Day | In | Out | In | Out | Total Hours |
| Monday | 10 AM | 2:00 PM | 5:00 PM | 9:00 PM |  |
| Tuesday | 10:00 AM | 2:00 PM |  |  |  |
| Wednesday | 6:00 AM | 9:00 AM | 4:00 AM | 8:00 PM |  |
| Thursday | 10:00 AM | 2:00 PM | 5:00 PM | 8:00 PM |  |
| Friday | 6:00 AM | 10:00 AM | 4:00 PM | 9:00 PM |  |
| Saturday | 6:00 AM | 2:00 PM | 4:00 PM | 7:00 PM |  |
| Sunday | OFF | OFF | OFF | OFF |  |
|  |  | Hours | Salary Per hour | Total Salary |  |
| Regular Hours |  |  | \$10.00 |  |  |
| Overtime |  |  | \$15.00 |  |  |
| TOTAL |  |  |  |  |  |

5. If David worked these hours each week, how much would he make in:
a. 2 weeks? $\qquad$

## Personal Finances

b. 4 weeks?
c. 1 year?
6. David relies on tips. Breakfast is served until 10:00 am. He usually makes about $\$ 40$ for a breakfast shift, $\$ 60$ for a lunch shift and $\$ 90$ for a supper shift.
a. How much does David make in tips for the week? $\qquad$
b. How much does David make all together for one week? $\qquad$
c. How much does that add up to per hour? (rounded to the nearest cent)
7. If David worked the same hours each week (as per the time card) and made the same amount in tips, how much would he make in:
a. 2 weeks? $\qquad$
b. 4 weeks? $\qquad$
c. 1 year? $\qquad$

## Earnings Statement \#6

Addition, subtraction, multiplication, division, percents
Below is an earnings statement for Sarah. Below is some terminology you will need to know to answer the questions:

- Gross pay is the amount of money made before deductions
- Net pay is the amount of money made after deductions (take home pay)
- YTD means Year to Date
- Federal Tax is the tax taken off by the federal government
- NWT Tax is the tax taken off by the NWT government
- C.P.P. means Canada Pension Plan
- E.I. means Employment Insurance

| Earnings Statement |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employee: Sarah |  |  |  | From: 12/1 | To: 12/14 |
| Earnings |  |  |  | Deductions |  |
| Description | Hours | Rate | Amount | Description | Amount |
| Regular | 80 | \$15.00 | \$1,200.00 | Federal Tax | \$180.00 |
| Over time | 4 | \$22.50 | \$90.00 | NWT Tax | \$70.80 |
|  |  |  |  | C.P.P | \$64.39 |
|  |  |  |  | E.I. | \$47.50 |
| Total |  |  | \$1,290.00 | Total | \$362.69 |
| Gross Pay |  |  |  | This Period | YTD |
|  |  |  |  | \$1,290.00 | \$29,670.00 |
| Net Pay |  |  |  | \$837.31 | \$18,505.30 |

Personal Finances

Part 1: Answer the following questions using the earnings statement on the previous page for Sarah. A normal day is 8 hours long.

1. How much was put into Sarah's Canada Pension Plan this pay period? $\qquad$
2. How much was taken off for E.I. this pay period? $\qquad$
3. How much were Sarah's gross earnings during this pay period? $\qquad$
4. How much did Sarah earn on an average day assuming that she worked a regular work week? $\qquad$
5. How many hours did Sarah work during this pay period? $\qquad$
6. How much were Sarah's deductions? $\qquad$
7. How much did Sarah take home (after deductions) this pay period?
$\qquad$
8. How much was taken for Federal Tax this pay period? $\qquad$
9. What are Sarah's gross earnings this year so far? $\qquad$
10. What are Sarah's net earnings this year so far? $\qquad$
11. Sarah gets time and a half for working overtime. If she works 10 hours overtime, how much gross pay would she receive? $\qquad$

Part 2: Complete the earnings statement below and answer the questions on the next page. A normal day is 8 hours.

Example: Lisa made $\$ 2350$ for a two week period. She paid $\$ 352.50$ in federal taxes.
Problem: What percent was taken off in federal tax?
Solution: Step 1: Divide the taxes by the amount made $\$ 352.50 \div \$ 2350=.15$ (you will always end up with a decimal)

Step 2: $\quad$ Multiply $.15 \times 100$ to find the percent $=15 \%$
$15 \%$ was taken off for federal tax.

| Earnings Statement |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Employee: Patricia |  |  |  | From: 07/1 | To: 07/14 |
| Earnings |  |  |  | Deductions |  |
| Description | Hours | Rate | Amount | Description | Amount |
| Regular | 80 | \$22.00 | \$1,760.00 | Federal Tax | \$298.65 |
| Overtime | 7 | \$33.00 | \$231.00 | NWT Tax | \$117.47 |
|  |  |  |  | C.P.P | \$78.23 |
|  |  |  |  | E.I. | \$46.59 |
| Total |  |  |  | Total |  |
|  |  |  |  | This Period | YTD |
| Gross Pay |  |  |  |  | \$28, 500 |
| Net Pay |  |  |  |  | \$19,500 |

1. What was Patricia's gross pay? $\qquad$
2. What were Patricia's deductions? $\qquad$

Personal Finances
3. What was Patricia's net pay? $\qquad$
4. How many hours did Patricia work during this pay period? $\qquad$
5. How much gross pay has Patricia made this year? $\qquad$
6. How much net pay has Patricia made this year? $\qquad$
7. How much more money does Patricia make per hour in overtime? $\qquad$
8. How much did Patricia make in overtime during this pay period? $\qquad$
9. What percent was taken off for all deductions?(round to the nearest percent)
$\qquad$
10. What percent was taken off for federal tax? (round to the nearest percent)
$\qquad$
11. What percent was taken off for NWT tax? (round to the nearest decimal)

1) $\$ 1991$
2) $\$ 540.94$
3) $\$ 1450.06$
4) 87 hours
5) $\$ 28,500$
6) $\$ 19,800$
7) $\$ 11$
8) $\$ 231$
9) $27 \%$
10) $15 \%$
11) $5.9 \%$

## Calculating Gross Weekly Wages \#7

Multiplication, division, addition and subtraction, rounding off

Some people earn a salary, while others may earn a small salary plus commission on sales. People earn money in many different ways.

Example 1: A traditional beader and sewer gets paid $\$ 250$ per pair of moccasins. It takes her 20 hours to complete a pair and it costs her \$30 in materials.

Problem 1: How much would she get paid if she made 5 pairs of
 moccasins per month.

Solution: $\$ 250 \times 5=\$ 1250$
$\$ 30 \times 5=\$ 150$
\$1250-\$150 = \$1100
She would make $\$ 1100$ after expenses.

Problem 2: How much per hour does she make?
Solution: 20 hours x $5=100$ hours
$\$ 1100 \div 100=\$ 11$ per hour
She makes $\$ 11$ per hour.
Problem 3: How much would she make in one year if she consistently made and sold 5 pairs of moccasins per month?
Solution: $\quad \$ 1100 \times 12=\$ 13,200$
She would make $\$ 13,200$ per year.

Example 2: John earns $\$ 31,200$ a year plus commission. One week he grossed $\$ 725$. He had sold $\$ 2500$ worth of merchandise.
Problem 1: How much does he make per week not including commission.

Solution: $\quad \$ 31,200 \div 52$ weeks $=\$ 600$

He makes $\$ 600$ per week.
Problem 2: How much did he make in commission?
Solution: $\quad \$ 725-\$ 600=\$ 125$
He made $\$ 125$ in commission.
Problem 3: What is his rate of commission?
Solution: $\quad \$ 125 \div \$ 2500 \times 100=5 \%$
His rate of commission is $5 \%$.

Directions: Calculate how much each person makes. Round your answers to the nearest cent.

## A. Salary

1. Sally's job pays her $\$ 3,500$ per month. What is her gross average weekly wage? $\qquad$
2. Jim grosses $\$ 27,000$ a year. What is his gross weekly wage?
$\qquad$
B. Hourly (A regular work week is 40 hours. Overtime pay is time and one-half).
3. Sue drives a truck for $\$ 15$ an hour. If she worked 40 hours, what would be her gross earnings for one week? $\qquad$
4. Mark is a water truck driver. He makes $\$ 18$ an hour. Determine his earnings for a week if he worked 52 hours. $\qquad$

## C. Piece Work

1. Gillian gets paid 17 cents a tree for tree planting in northern British Columbia. In one week she planted 2437 trees. What is her wage?
2. A seamstress is paid $\$ 10$ for every pair of pants made. How many pants would have to be made to receive $\$ 520$ a week? $\qquad$

## D. Straight Commission

1. A real estate agent earns $2.4 \%$ on the sale of a house priced at $\$ 289,950.00$. How much does she earn on that house? $\qquad$
2. A salesperson sells $\$ 5780$ worth of merchandise in one day. From working on commission his gross pay for that day was $\$ 179.18$. What is his rate of commission? $\qquad$

## E. Salary Plus Commission

1. Dave earns $\$ 150$ per week plus $3.8 \%$ commission. He sold $\$ 4175.68$ in the month of February. What is his gross monthly earning for February?
2. Mary earns $\$ 41,600$ a year not including commission. One week she grossed $\$ 950$. She had sold $\$ 5000$ worth of merchandise. What is her rate of commission? $\qquad$

Personal Finances

## F. Hourly Wage Plus Commission

1. Julie is a sales clerk at a bicycle shop. She is paid $\$ 12.25$ per hour plus she is given a commission of $8 \%$ of sales. In one week she worked 30 hours and her sales were $\$ 2319.75$. What is her gross weekly earnings for that week? $\qquad$
2. Sam is paid $\$ 14$ per hour plus $6 \%$ of sales. If he worked 37.5 hours in one week, what would his sales need to be for him to make $\$ 733.50$ per week before taxes? $\qquad$

## More on Wages \#8

## Multiplication, addition

Calculate gross earnings for one week given the hours worked and the hourly rate. A regular work week is 40 hours. Overtime pays time and one half. For example if a person was paid $\$ 10$ per hour, time and one half would be $\$ 15$ per hour.

1. Job: Truck Driver
Hours Worked: ..... 40
Hourly Rate: ..... \$20.75
2. Job:Word Processing Operator
Hours Worked: ..... 35.5
Hourly Rate: ..... \$16.50
3. Job: Labourer
Hours Worked: ..... 51
Hourly Rate: ..... \$20.00
4. 

Job:
Hours Worked:
60

Hourly Rate:
$\$ 40.00$
5. Job:

Hours Worked:
41

Hourly Rate: \$44
6. Job:

Tutor

Hours Worked:
17
Hourly Rate: $\quad \$ 35.00$

## Paying I ncome Tax \#9

Percent, multiplication, subtraction, addition
Everyone has taxes taken off their pay cheque. Taxes go towards things like health care, roads and health and social programs. In the NWT we have both federal tax and NWT tax.

This is how it works for federal tax on all taxable income for the year 2008:

- $15 \%$ on the first $\$ 38,832$
- $22 \%$ on the next 38,832 (on the portion between $\$ 38,832$ and $\$ 77,664$ )
- $26 \%$ on the next $\$ 48,600$ (on the portion between $\$ 77,664$ and $\$ 126,264$ )
- $29 \%$ over $\$ 126,264$

The NWT tax is much less (all based on taxable income for the year 2008):

- $5.9 \%$ on the first $\$ 36,885$ of taxable income
- $8.6 \%$ on the next $\$ 36,886$ (on the portion between $\$ 36,885$ and $\$ 73,771$ )
- $12.2 \%$ on the next $\$ 46,164$ (on the portion between $\$ 73,771$ and $\$ 119,935$ )
- $14.05 \%$ on the amount over $\$ 119,936$

Example: Laurie makes $\$ 45,891$ per year.
Problem: How much is taken off in federal tax?
Solution: Step 1: Calculate $15 \%$ of $\$ 38,832 \quad(15 \%=.15)$
$\$ 38,832 \times .15=\$ 5824.80$
Step 2: $\quad \$ 45,891-\$ 38,832=\$ 7,059$
Step 3: Calculate $22 \%$ of $\$ 7,059 \quad(22 \%=.22)$
$\$ 7,059 \times .22=\$ 1,552.98$
Step 4: $\quad$ Add together: $\$ 5,824.80+1,552.98=\$ 7,377.78$
Laurie has $\$ 7,377.78$ taken off in federal taxes per year.

Personal Finances

Directions: Answer the problems below about federal and NWT tax. Round your answers to the nearest cent.

1. Susan makes $\$ 35,800$ per year.
a. How much does she pay in federal tax?. $\qquad$
b. How much does she pay in NWT tax? $\qquad$
c. How much is her annual net pay if she also pays $\$ 780$ in E.I. and $\$ 2150$ in C.P.P. in one year.? $\qquad$
d. What percent of deductions is taken off her yearly salary (including E.I. and C.P.P)? Round your answer to the nearest percent. $\qquad$
2. John makes $\$ 87,900$ per year. He pays $\$ 1550$ in E.I. and $\$ 3500$ in C.P.P in one year. He also pays $\$ 670$ in health benefits per year. Round your answers to the nearest cent.
a. How much does he pay in federal tax? $\qquad$
b. How much does he pay in NWT tax? $\qquad$
c. How much is his annual net pay? $\qquad$
d. What percent of deductions (all deductions including E.I., C.P.P. and health benefits) is taken off his yearly salary? Round your answer to the nearest percent. $\qquad$
3. Joan makes $\$ 123,790$ per annum.
a. How much does she pay in federal tax?. $\qquad$
b. How much does she pay in NWT tax? $\qquad$
c. How much does she pay in taxes? $\qquad$
d. What percentage does she pay in taxes? Round your answer to the nearest percent. $\qquad$
e. How much net pay would she receive if she gets paid every two weeks?
4. Helen makes $\$ 45$ per hour and she works 37.50 hours per week.
a. How much money does she make per year? $\qquad$
b. How much does she pay in federal tax?. $\qquad$
c. How much does she pay in NWT tax? $\qquad$
d. How much does she pay in taxes?
e. What percentage does she pay in taxes? Round your answer to the nearest percent. $\qquad$
f. How much net pay would she receive if she gets paid every two weeks?

Personal Finances

## Cashing Cheques \#10

## Percent, multiplication, addition, subtraction

Some people like to cash their cheques at the local cheque cashing place. These places often make their money by taking off a certain amount of money per cheque. It is better to have a bank account. Banks do have some fees but they are not near the amount that
 some companies charge.

One place charges a standard fee of $\$ 3.99$ for each cheque and they also charge $3.99 \%$ of the amount of the cheque. For example: If I had a cheque for $\$ 1000$, I would be charged $\$ 3.99$ (standard fee) and $3.99 \%$ of the $\$ 1000$. This would amount to $\$ 43.89$.

Example: Derek wants to cash his cheque from work at the Money Mart. His cheque is for $\$ 1100.43$

Problem: How much money will he get back after Money Mart takes their cut?
Solution: Step 1: Change the percent 3.99 into a decimal . 0399
Step 2: $\quad 1100.43 \times .0399=\$ 43.91$ (rounded to the nearest cent)
Step 3: $\quad \$ 43.91+\$ 3.99=47.90$ (add the standard fee)
Step 4: $\quad 1100.43-\$ 47.90=\$ 1052.53$. (subtract from original amount)
Derek will receive $\$ 1052.53$. If he does this with every pay cheque assuming he gets paid every two weeks - he will pay $\$ 1245.40$ in fees in one year.

Directions: Find out how much the fee is for these people when they use a cheque cashing business. Use the same fees in the example on the previous page: $\$ 3.99$ per cheque and 3.99 \% of the amount of the cheque. Round your answers to the nearest cent.

1. Jodi cashes her Income Support cheque at the Money Mart. Her cheques are for $\$ 1550$ per month. How much money does Jodi pay in fees? How much does she pay over the year?
2. Sam was left some money from his aunt. He has a cheque for $\$ 5500$. He goes to the Money Mart to cash it. How much money does he pay in fees? How much money does he take home?
3. Sarah needs money fast. She has a cheque worth $\$ 2400$. How much will she pay in fees? How much will she take home?
4. Karen went and got her taxes done and she is getting back $\$ 3300$ in taxes. She is very excited and wants to use the money to buy a used van. She goes to the cheque cashing business in town and cashes her cheque. How much money will she pay in fees? How much will she take home?
5. Owen cashes his regular pay cheques at the cheque cashing place in town. He makes $\$ 2500$ per month. Calculate how much does he pay in fees in one year? He gets paid once a month.

Personal Finances
Doing Your Taxes \#11
Percent, multiplication, addition, subtraction
Every year we do our taxes. There are several ways you can do your taxes. You can do them on your own either through a tax program on the computer or you can fill out the forms by hand. You could get a registered accountant to do your taxes or you could go to a place like H \& R Block.

Some people like to get what's called "cash back." "Cash back" means that the business doing your taxes will give you a cheque right away for your taxes. This can be very convenient but also quite expensive.

Some places charge $15 \%$ on the first $\$ 300$ and then $5 \%$ on the remaining amount.

Example: Sarah gets her taxes done at a local tax place in Yellowknife. They calculate that she should get $\$ 2300$ back from the government. She opts to get "cash back."
Problem: How much money does Sarah get back after she pays the fees for the service?
Solution Step 1: Convert 15\% into a decimal =. 15
Step 2: $\quad$ First $\$ 300 \times .15=\$ 45$
Step 3: $\quad$ Subtract $\$ 2300-\$ 300=\$ 2000$
Step 4: $\quad$ Convert $5 \%$ into a decimal $=.05$
Step 5: $\quad \$ 2000 \mathrm{x} .05=\$ 100$
Step 6: $\quad$ Add $\$ 100+\$ 45=\$ 145$
Step 7: $\quad$ Subtract $\$ 2300-\$ 145=\$ 2155$
Sarah will get back $\$ 2155$. The fee for the service is $\$ 145$.

Directions: Answer the following questions about "cash back." Use the fees of $15 \%$ on the first $\$ 300$ and $5 \%$ on the remaining money.

1. Jeff is getting back $\$ 4500$ in taxes. He opts to get "cash back." How much money does he pay in fees? How much money will he get back?
2. Sally is getting back $\$ 5800$ in taxes. She has decided that she will get "cash back" only if she has to pay under $\$ 250$. How much will the fee for "cash back" be? What does she decide to do?
3. Mary Rose needs to decide whether she will get "cash back" or just pay the regular fee for getting her taxes done and wait for her cheque from the government. The regular fee is $\$ 90$. She is supposed to get back $\$ 1600$. Calculate how much she will pay in fees for "cash back." Compare this number to the regular fee. What is the better option for Mary Rose?
4. Kathryn needs money quick. She wants to buy a bike for her daughter. The bike costs $\$ 450$. She gets her taxes done and decides to get "cash back." She was supposed to get back $\$ 3300$. How much will she get back after she pays the fees? How much money will she have after she buys her daughter a bike?

## Personal Finances Review \#12

Answer the following questions about this section. Make sure you round your answers to the nearest cent.

1. Susie needs to cut her expenses by $\$ 150$ per month. She decides to cut out her daily cappuccino during the week. It costs $\$ 4.50$.
a. If she cuts her spending by $\$ 150$ per month, how money will she save in one year? $\qquad$
b. How much does she save weekly by cutting out her daily cappuccino?
c. How much does she save yearly? $\qquad$
d. How much does she still need to save per year to reach her goal?
2. Emily makes $\$ 24$ per hour. She worked 80 hours of regular time for the last pay period and 5 hours of overtime at $\$ 36$ per hour.
a. What was her gross pay? $\qquad$
b. How much money in deductions was taken off her cheque if her net pay was \$1719.50? $\qquad$
c. What percent was taken off as deductions? (to one decimal place)
3. Chad makes $\$ 16$ per hour. How much would he make for overtime hours?

Refer back to page 26 for the next two questions.
4. Paul makes $\$ 45,000$ per year. Calculate how much he pays in federal tax.
5. Brenda makes $\$ 95,000$ per year.
a. How much does Brenda have taken off in federal tax? $\qquad$
b. How much does Brenda have taken off in NWT tax? $\qquad$
c. What percent of taxes does Brenda have taken off her cheque? Round to the nearest decimal place. $\qquad$
6. There are several places that cash cheques for a fee in Yellowknife. One place charges $\$ 3.99$ per cheque and $3.99 \%$ of the amount of the cheque. Another place charges a straight $4.05 \%$ of the amount of the cheque. Lisa has a cheque for $\$ 1250.00$ that she would like to get cashed. (Round all your answers to the nearest cent.)
a. How much will she pay in fees at the place that charges $\$ 3.99$ per cheque and $3.99 \%$ of the amount of the cheque? $\qquad$
b. How much will she pay at the place that charges $4.05 \%$ of the amount of the cheque? $\qquad$
c. Which place should she go to? $\qquad$
d. How much does she pay in fees if she decides to get all her cheques cashed at this place for the year? She gets paid bi-weekly. $\qquad$
7. Jerri needs to get her taxes done and she wants to get "cash back." The local place charges $15 \%$ on the first $\$ 300$ and $5 \%$ on the remaining amount. She is supposed to get $\$ 5,000$ back in taxes.
a. What will the fee be for "cash back?" $\qquad$
b. How much will she get back? $\qquad$

## Personal Finances Projects

1. Set up a money management group in your classroom. Track your spending for one month. Share your information with others in the group. Come up with a budget and spending plan.
2. Look at you what you spend money on. How can you cut down on your expenses? What can you cut out?
3. Research three jobs that you are interested in and find out how much each job makes annually. Find out what training is needed for each job.
4. Do you cash your cheques at a cheque cashing place? If you do - calculate how much you can save by setting up a bank account and cashing your cheques through the bank or using direct deposit.
5. Set up a savings account and try and put a little money away each month.

## Saving Money

This section has activities about saving money and earning interest. In this section you will be required to use a variety of math skills:

- Addition
- Subtraction
- Multiplication
- Division
- Order of Operations
- Percent
- Exponents
- Problem Solving

This section has the following worksheets:

- Worksheet \#13: Saving Money
- Worksheet \#14: Saving for Retirement
- Worksheet \#15: Simple Interest on Your Savings
- Worksheet \#16: Earning Compound Interest
- Worksheet \#17: More on Earning Compound Interest
- Worksheet \#18: Advanced Compound Interest
- Worksheet \#19: Return on Investment
- Worksheet \#20: Saving Money Review

This section also has a Saving Money projects page.

Saving Money \#13
Multiplication, division, addition
It is always important to save some money for a rainy day. There are many ways to save money. You can put it under your pillow or you can put it in the bank. You could also invest it in RRSPs or in stocks and bonds

Example: Stuart saves $\$ 50$ from his pay cheque every two weeks.
Problem: Calculate how much Stuart saves in one year (assuming he is not getting any interest on his money).

Solution: Step 1: First of all we must calculate how many pay cheques Stuart gets in one year. He is paid every two weeks. There are 52 weeks in one year. 52 weeks $\div 2=26$ pay cheques
Step 2: $\quad 26 \times \$ 50=\$ 1300$
Stuart saves $\$ 1300$ each year.

Directions: Calculate how much each person saves.

1. Susie saves $\$ 300$ per month.
a. How much does she save each year? $\qquad$
b. How much does she have after 10 years? $\qquad$
2. Matt saves $\$ 100$ one month, $\$ 50$ for 3 months, $\$ 150$ for 4 months and $\$ 75$ for the rest of the months in that year. How much does Matt save in one year? $\qquad$
3. Jane saves $\$ 35$ each week.
a. How much does she save in $1 / 2$ a year? $\qquad$
b. How much does she save in one year? $\qquad$
4. Josh saves $\$ 950$ in six months.
a. If he continues to save at this rate, how much money will he save in 5 years?
b. How much will he have in 10 years? $\qquad$
5. Mary's daughter wants to save some money. She is saving $\$ 5$ from her weekly allowance.
a. How much will she save in 1 year? $\qquad$
b. How much will she save in 5 years? $\qquad$
6. Andrew wants to save enough money for a down payment on a car. He needs $\$ 2600$. He saves $\$ 50$ per week. How long will it take him to save $\$ 2600$ ?

Saving Money

## Saving for Retirement \# 14

Reading charts, subtraction
Directions: Use the following table and answer the questions below:

| Years | Save <br> $\$ 50$ <br> per month | Save <br> $\$ 100$ <br> per month | Save <br> $\$ 200$ <br> per month |
| :---: | :---: | :---: | :---: |
| 1 | $\$ 602.76$ | $\$ 1,104.59$ | $\$ 2,209.19$ |
| 5 | $\$ 3,074.96$ | $\$ 6,044.86$ | $\$ 12,089.75$ |
| 10 | $\$ 6,307.50$ | $\$ 12,504.66$ | $\$ 25,009.20$ |
| 15 | $\$ 9,705.72$ | $\$ 19,295.46$ | $38,590.87$ |
| 20 | $\$ 13,278.16$ | $\$ 26,434.31$ | $\$ 52,868.59$ |
| 25 | $\$ 17,033.69$ | $\$ 33,939.05$ | $\$ 67,878.08$ |
| 30 | $\$ 20,981.70$ | $\$ 41,828.42$ | $\$ 83,656.85$ |
| 35 | $\$ 25,132.02$ | $\$ 50,122.17$ | $\$ 100,244.35$ |
| 40 | $\$ 29,495.09$ | $\$ 58,840.97$ | $\$ 117,682.02$ |

1. Jacob, who is 44 years old, wants to take a year off once he saves $\$ 38,590.87$. How many years will it take for this goal to be reached if he saves $\$ 200$ per month?
2. How much will Alyssa have saved if Alyssa deposits $\$ 200$ per month for 20 years? $\qquad$
3. How much will Olivia have saved if Olivia deposits $\$ 100$ per month for 20 years? $\qquad$
4. Hannah, who is 43 years old, wants to be sure to save enough for retirement at age 58. If Hannah plans on saving $\$ 200$ per month, then how much will Hannah have at retirement? $\qquad$
5. How long will Logan have to save if Logan deposits $\$ 100$ per month and wants to accumulate $\$ 58,840.97$ ? $\qquad$
6. Larry who is 30 years old wants to be sure to save enough for retirement at age 60 . If he plans on saving $\$ 100$ per month, then how much will Larry have at retirement?
$\qquad$ Do you think this is enough to retire on? $\qquad$ Why or why not? $\qquad$
7. If Susie starts putting away $\$ 50$ per month at the age of 20 , how much money will she have when she is 60 ? $\qquad$
8. How much more money will I save if I invest $\$ 200$ per month for 40 years versus 30 years? $\qquad$
9. How much more money will I save if I invest $\$ 200$ per month versus $\$ 50$ per month for 40 years? $\qquad$

## Simple I nterest on Your Savings \#15

Percent, multiplication, order of operations
Saving money at a bank or other institution allows you to store your money with someone else. The money that you earn for doing this is called interest. Interest is a percentage of the amount you have deposited. Simple interest is only calculated on the principal amount of money invested or borrowed. For example: Joan put $\$ 1000$ in the bank and she is going to gain $3 \%$ simple interest on her money over three years. She will make $\$ 30$ each year.

The formula for simple interest is $\quad$ Interest $=$ Principal $\mathbf{x}$ rate $\mathbf{x}$ time or $\mathrm{I}=$ Prt The formula for the total amount owed (interest plus the principal amount) is:

$$
\mathrm{A}=\text { Principal }(1+\text { rate } \mathrm{x} \text { time }) \mathrm{A}=\mathrm{P}(1+\mathrm{rt})
$$

$\boldsymbol{A}$ is the final amount including the principal.
$\boldsymbol{P}$ is the principal amount.
$r$ is the rate of interest per year.
$t$ is the number of years invested.
1 is the number one

Example 1: Lisa saves $\$ 1500$ at $3 \%$ simple interest. She has it in the bank for two years.
Problem: How much interest will Lisa receive in two years?
Solution: Step 1: The interest rate must be converted into a decimal: $3 \%=.03$
Step 2: $\quad$ Interest $=\$ 1500 \times .03 \times 2$ years $=\$ 90$
Lisa will get $\$ 90$ in interest after two years.

Example 2: Craig puts $\$ 3000$ in the bank. The bank offers a simple interest of $2.5 \%$ per year.

Problem: How much will he have after 2.5 years?
Solution: Step 1: The interest rate must be converted into a decimal: 2.5\% = . 025
Step 2: Use the formula to calculate the end amount after 2.5 years:

$$
\mathrm{A}=\mathrm{P}(1+\mathrm{rt})
$$

$$
A=\$ 3000(1+.025 \times 2.5)=\$ 3187.50
$$

Craig will have \$3187.50 after $21 / 2$ years.

Part 1: Answer the questions below about simple interest.

1. The amount that you earn when you invest your money:
a) Interest
b) Term
c) Principal
d) Rate
2. The amount of the original investment is called:
a) Interest
b) Term
c) Principal
d) Rate
3. The three elements used to calculate simple interest are: $\qquad$ ,
$\qquad$ , $\qquad$ .

Saving Money

Part 2: Calculate the simple interest for the following:
4. Principal amount $=\$ 4000$

Interest rate $=4 \%$
Time $=3$ years
$\qquad$
6. Principal amount $=\$ 10,000$

Interest rate $=4 \%$
Time $=4$ years
$\qquad$
8. Principal amount $=\$ 15,000$

Interest rate $=2.3 \%$
Time $=6$ months
10. Principal amount $=\$ 5000$

Interest rate $=1.3 \%$
Time $=9$ months
5. Principal amount $=\$ 2500$

Interest rate $=5 \%$
Time $=2$ years
$\qquad$
7. Principal amount $=\$ 8000$

Interest rate $=1.9 \%$
Time $=6.5$ years
$\qquad$
9. Principal amount $=\$ 3500$

Interest rate $=2.8 \%$
Time $=2.5$ years
11. Principal amount $=\$ 2000$

Interest rate $=4.3 \%$
Time $=18$ months

Part 3: Solve the following simple interest problems.

$$
\begin{aligned}
& \text { Interest = Principal x rate x time or } \mathrm{I}=\mathrm{Prt} \\
& \mathrm{~A}=\text { Principal }(1+\text { rate } \mathrm{x} \text { time }) \text { or } \mathrm{A}=\mathrm{P}(1+\mathrm{rt})
\end{aligned}
$$

12. Susan invests $\$ 5000$. She is getting $4 \%$ simple interest over 4 years. How much interest will Susan earn after 4 years?
13. How much money will Susan have after 4 years?
14. Larry invests $\$ 10,000$ in stocks. The bank will give him $6 \%$ simple interest for 5 years. Larry decides to pull out his money in 3 years. How much money will he have?
15. Donna invests $\$ 500$ for a one year period. At the end of the year, she earns $\$ 50$ in interest. What was the interest rate on the principle amount? $\qquad$
16. Henry invests $\$ 5000$ in a mutual fund with an annual interest of $7.5 \%$. How much money will he have in one year?
17. How much interest does a $\$ 10,000$ investment earn at $5.6 \%$ over 18 years?
18. How long would it take to have $\$ 7650$ if your principal amount was $\$ 5000$ with a $12 \%$ interest rate? Round your answer to one decimal place.

## Earning Compound I nterest \#16

## Percent, addition, subtraction

Christopher's bank pays 5\% a year interest on the previous year's balance - this is called compound interest. For the first year, Christopher deposited $\$ 6,000$ into the bank. If each year Christopher does not withdraw any money - how much will he have after 8 years? Round your answers to the nearest cent.
Beginning Balance ..... \$6,000
Interest earned in Year 1 (6,000 x . 05 ) ..... $\$ 300$
Total after Year 1\$6,300
Interest earned in Year 2 ..... \$315
Total after Year 2 ..... \$6,615Interest earned in Year 3Total after Year 3Interest earned in Year 4
Total after Year 4
Interest earned in Year 5
$\qquad$
Total after Year 5
Interest earned in Year 6
Total after Year 6
Interest earned in Year 7
Total after Year 7
Interest earned in Year 8
Total after Year 8
How much money in interest did Christopher earn altogether? $\qquad$
There is a much easier way to calculate compound interest!

## More on Earning Compound I nterest \#17

Percent, exponents, order of operations, multiplication, division, addition
Interest is the amount you receive for lending money (making an investment) or the fee you pay for borrowing money. Compound interest is interest that is calculated using both the principal and the interest that has accumulated.

If you invest $\$ 1000$ at a simple interest rate of $5 \%$ annually, you will receive $\$ 50$ for every year your money remains invested. At the end of one year you will earn $\$ 50$, after 2 years you'll earn $\$ 100$, after three years you'll earn $\$ 150$, etc. At the end of 10 years you will have earned $\$ 500$ and would have $\$ 1500$.

Now if you invest the same amount of money with compound interest, you will earn interest on the original principle plus on the interest that has accumulated.

Example: Invest $\$ 1000$ at a rate of 5\% interest compounded annually (once a year) for 10 years. The following table shows how your investment will grow. Answers are rounded to the nearest cent.

|  | Principle | Interest Paid (principle x 5\%) | Annual Running Total |
| :--- | :--- | :--- | :--- |
| Year 1 | $\$ 1000$ | $\$ 50$ | $\$ 1050$ |
| Year 2 | $\$ 1050$ | $\$ 52.50$ | $\$ 1102.50$ |
| Year 3 | $\$ 1102.50$ | $\$ 55.13$ | $\$ 1157.63$ |
| Year 4 | $\$ 1157.63$ | $\$ 57.88$ | $\$ 1215.51$ |
| Year 5 | $\$ 1215.51$ | $\$ 60.77$ | $\$ 1276.29$ |
| Year 6 | $\$ 1276.29$ | $\$ 63.81$ | $\$ 1340.10$ |
| Year 7 | $\$ 1340.10$ | $\$ 67$ | $\$ 1407.11$ |
| Year 8 | $\$ 1407.11$ | $\$ 70.36$ | $\$ 1477.46$ |
| Year 9 | $\$ 1477.46$ | $\$ 73.87$ | $\$ 1551.33$ |
| Year 10 | $\$ 1551.33$ | $\$ 77.57$ | $\$ 1628.89$ |

With compound interest you earn an additional \$128.89.

## Saving Money

The formula for compound interest that is calculated yearly is:
$\mathbf{A}=\mathbf{P}(\mathbf{1}+\mathbf{r})^{\mathrm{t}}$
$\boldsymbol{A}$ is the final amount including the principal.
$\boldsymbol{P}$ is the principal amount.
$\boldsymbol{r}$ is the rate of interest per year.
$t$ is the number of years invested.

Example 1: Let's say that I have $\$ 1000$ to invest for 3 years at rate of $5 \%$ compound interest.

Problem: How much money will you have in 3 years?
Solution: $\quad A=P(1=r)^{t}$
$A=1000(1+0.05)^{3}=\$ 1157.62$.
You can see that my $\$ 1000$ is worth $\$ 1157.62$ after 3 years.

Example 2: I invest $\$ 10,000$ for 2 years at a $6.7 \%$ interest rate.
Problem: How much money will I have in two years?
Solution: Step 1: Convert the $6.7 \%$ into a decimal: $6.7 \%=.067$
Step 2: Plug the numbers into the formula.

$$
A=10000(1+0.067)^{2}=\$ 11,384.89
$$

I will have $\$ 11,384.89$.

Part 1: Use the formula and calculate the amount after compound interest has been calculated for each situation. Round your answers to the nearest cent.

$$
A=P(1+r)^{t}
$$

1. Sue has $\$ 22,000$ in investments. She earns $5 \%$ compound interest over 5 years. How much money will Sue have after year 1, year 2, year 3, year 4, and year 5?
2. Lin invests $\$ 500$ for 5 years at a rate of $4 \%$ compound interest. How much money will she have at the end of 5 years?
3. Mike invests $\$ 1000$ for 4 years at $4 \%$ interest and the following year he invests $\$ 3000$ for 3 years at $2 \%$ interest. How much money will he have after 4 years?
4. Jill invests $\$ 5000$ at a $5.9 \%$ compound interest rate. The investment is for 2 years. How much money will she have at the end of 2 years?
5. Joey invests $\$ 2500$ for 4 years at a rate of $3 \%$ compound interest. How much money will he have at the end of 4 years?

Year 1: $\qquad$
Year 2: $\qquad$
Year 3: $\qquad$
Year 4: $\qquad$
Year 5: $\qquad$
$\qquad$
路

## Advanced Compound I nterest \# 18

Percent, exponents, order of operations, multiplication, division, addition
There are times when interest compounds more than once a year. The basis of the formula remains the same but you must adjust the annual interest rate to the rate per period. The formula looks like this:

$$
\mathrm{A}=\mathrm{P}(1+\mathrm{r} / \mathrm{n})^{\mathrm{nt}}
$$

$A=$ amount in the future
$P=$ amount paid at the beginning (principal)
$r=$ interest rate per year

$t=$ number of years
$n=$ number of payments per year

Example: I have 1 million dollars to invest at a $4 \%$ interest rate, compounded monthly.

Problem: How much would I make in interest after 6 years?
Solution: Plug the numbers into the formula. You will need a scientific calculator. If you do not have one, you can find one online.
$\mathrm{A}=1,000,000(1+.04 / 12)^{12 \times 6}$
$\mathrm{A}=1,000,000(1+.003333)^{72}$
$\mathrm{A}=1,000,000(1.003333)^{72}$
$\mathrm{A}=1,000,000(1.271)$
A $=1,271,000$
Interest $=1,272,000-1,000,000$
I would make 271,000 in interest after 6 years.

Directions: Calculate the compound interest and the amount in the future. Round your answers to the nearest cent. Use the formula:

$$
\mathrm{A}=\mathrm{P}(1+\mathrm{r} / \mathrm{n})^{\mathrm{nt}}
$$

1. Use the formula above and fill in the table below for an investment earning $4.5 \%$ annually and compounded twice a year.

|  | Principal | Interest Paid Per Year | Annual Running Total |
| :--- | :--- | :--- | :--- |
| Year 1 | 16,250 |  |  |
| Year 2 |  |  |  |
| Year 3 |  |  |  |
| Year 4 |  |  |  |
| Year 5 |  |  |  |

2. Use the information in Question One. Calculate the compound interest and future amount after 10 years.
3. How much interest does a $\$ 10,000$ investment earn at $5.6 \%$ over 18 years compounded quarterly (4 times per year)?

## Saving Money

4. How much does the investment in questions \#3 earn if the interest is compounded annually? How much is the difference?
5. You just won $\$ 1,000,000$ in the lottery. You would like to invest your money. You decide to invest your money for 20 years in a $4.5 \%$ interest rate compounded semiannually ( 2 times per year). How much money will you have after 20 years?
6. You decide to take your money out after 10 years. How much will you have in 10 years?
7. Let's say your parents decide to invest some money for you on your $18^{\text {th }}$ birthday. They invest $\$ 15,000$ at a $10 \%$ interest rate that is compounded quarterly. They have told you that you can't take out the money until you are 65 .
a. How much money will you have at age 65? Round your answer off to the nearest cent. $\qquad$
b. Are you surprised by this number? $\qquad$
c. How much would you get if you decided to take your money out when you were 50 years old? $\qquad$
d. What is the difference in money? $\qquad$
8. Let's say you decide to invest $\$ 3000$ at an $8 \%$ interest rate compounded semiannually for your 5 year old.
a. How much money will she or he get when she or he turns 65 ?
b. Are you surprised by this number? $\qquad$
c. How much would your child get if he or she took the money out when he or she turned 21? $\qquad$

Saving Money

## Return on Investment \#19

Subtraction, division, percent, decimals, order of operations

Often we put money into investments that fluctuate. We may not know what interest rate we are getting until we find out how much money we made or lost at the end of the year. This is called return on investment. Return on investment is a calculation of the amount, or percentage, that you have earned (or lost) on an investment you have made. Returns may be positive or negative. A positive return on investment would mean you earned money, and a negative return would mean you lost money. Return on investment is a percentage of the original amount you invested. Here is the formula:

$$
\text { ROI }=\frac{\mathbf{R}-\mathbf{I}}{\mathbf{I}} \times 100 \quad \begin{aligned}
& \mathrm{R}=\text { Money received after making the investment. } \\
& \mathrm{I}=\text { Original money invested. }
\end{aligned}
$$

Example: John invests $\$ 100$ in a mutual fund for one year. At the end of the year he has $\$ 108$.

Problem: What was his return on investment? Plug the numbers into the formula.
Solution: Step 1: $108-100=8$
Step 2: $\quad 8 \div 100=.08$
Step 3: $.08 \times 100=8 \%$
The return on investment was $8 \%$.

Directions: Finish filling in the following table. We will only look at gains on investments.

|  | Money <br> Received <br> R | Money Invested I | Gain or Loss R - I | Return on <br> Investment <br> Gain /I x 100 |
| :---: | :---: | :---: | :---: | :---: |
| 1. | 1,250 | \$1,000 | \$250 | \% |
| 2. | \$1,030 | \$1,000 | \$30 | _\% |
| 3. | \$1,180 | \$1,000 | \$180 | _\% |
| 4. | \$1,080 | \$1,000 | \$80 | _ \% |
| 5. | \$1,100 | \$1,000 | \$100 | _\% |
| 6. | \$1,000 | \$1,000 | \$0 | _ \% |
| 7. | \$10,900 | \$10,000 | \$900 | _\% |
| 8. | \$11,500 | \$10,000 | \$1,500 | _\% |
| 9. | \$10,200 | \$10,000 | \$200 | _ \% |
| 10. | \$10,500 | \$10,000 | \$500 | \% |

Saving Money

## Saving Money Review \#20

Formulas that you need for this review are:

Part 1: Calculate the simple and compound interest problems.

1. Find the total amount of money in an account that has:
a. $\$ 5000$ invested at $6 \%$ annual interest rate compounded yearly for 4 years.
b. $\$ 800$ invested at $12 \%$ annual interest rate compounded yearly for 5 years.
c. $\$ 20,500$ invested at $6 \%$ annual interest rate compounded monthly for 3 years.
d. $\$ 1600$ invested at $4 \%$ annual interest rate compounded quarterly for 5 years.
e. $\$ 12,800$ invested at $3.5 \%$ annual interest rate compounded semi-annually ( 2 times per year) for 2 years.
2. Find the total interest earned by investing:
a. $\$ 2800$ at $8 \%$ annual interest rate compounded yearly for 5 years.
b. $\$ 16,000$ at $12 \%$ annual interest rate compounded yearly for 3 years.
c. $\$ 550,000$ at $4 \%$ annual interest rate compounded monthly for 18 months.
d. $\$ 27,000$ at $12 \%$ annual interest rate compounded quarterly for 15 years.
3. Ned deposits $\$ 2500$ with Bank Zero at $6 \%$ annual interest rate compounded monthly for 3 years.
a. Calculate the amount of money in his account at the end of the period.
b. Joe deposits $\$ 2500$ with Bank Uno that pays annual simple interest rate. At the end of 3 years, Joe has as much money in his account as Ned above to the nearest dollar. Find the annual rate of interest that Bank Uno pays Joe to the nearest decimal. $\qquad$
4. Nora deposited $\$ 100$ into a saving account that pays an interest rate for one year. At the end of the period, Nora earned $\$ 25$ as total interest. Find the annual interest rate for Nora's account or rate of return. $\qquad$
5. Susie wants to earn as much interest as possible for her $\$ 25,000$ inheritance. She has two saving options.
i. Option 1 involves depositing the entire amount of $\$ 25,000$ into an account that pays $5 \%$ interest rate per year compounded yearly for 3 years.
ii. Option 2 involves depositing the entire amount of $\$ 25,000$ into an account that pays $3.5 \%$ interest rate per annum compounded monthly for 3 years.
a. Find the total amount of money in her account at the end of the 3 years period if she chooses option 1. $\qquad$
b. Find the amount of interest earned at the end of the 3 years period if she chooses option 2. $\qquad$
c. Which option would Susie choose given that she wants to earn as much interest as possible for her $\$ 25,000$ inheritance?
6. Linda decided to invest $\$ 7000$ when she was 20 years old. On average she earned $7 \%$ compounded interest monthly.
a. How much money will she have when she is 40 ? $\qquad$
b. How much money will she have when she is 60 ? $\qquad$
c. How much money will she have when she is 70 ? $\qquad$
d. How much more will she make if she keeps her investment until she is 70 instead of cashing in at 60 ? $\qquad$

## Saving Money Projects

1. Figure out how long it would take a $\$ 10,000$ investment to turn into a million dollars at 7\% monthly return.
2. What would you spend a million dollars on?
3. A billion dollars is a hard number to comprehend. A billion dollars is a lot of cash. Well, that depends on who you speak to. Bill Gates, the visionary sultan of Microsoft, made a cool 50 billon in 2005. That translates to $\$ 416,666,666$ a month. According to Forbes Magazine there were 793 billionaires across the globe in 2005. How many millions are in a billion?
4. What would you do with a billion dollars?
5. Set up a savings account and put away $\$ 50$ per month and watch your money grow.
6. Set up a savings account for your child or children.
7. Go to a bank and compare bank accounts. Open an account that fits your needs.

## Consumer Math

This section has activities about spending money from tipping to buying on credit. In this section you will be required to use a variety of math skills:

- Addition
- Subtraction
- Multiplication
- Division
- Order of Operations
- Percent
- Problem Solving
- Estimation

This section has the following worksheets:

- Worksheet \#21: Tipping
- Worksheet \#22: Short Cut to Tipping
- Worksheet \#23: The Cost of Eating Out
- Worksheet \#24: Vacation Travel
- Worksheet \#25: Taking Out a Personal Loan
- Worksheet \#26: Discounts
- Worksheet \#27 Installment Buying
- Worksheet \#28: Cell Phones
- Worksheet \#29: Fuel Consumption
- Worksheet \#30 Finding Fuel Consumption
- Worksheet \#31 Renting a Vehicle
- Worksheet \#32: Consumer Math Review

This section also has a Consumer Math projects page.

Consumer Math
Tipping \#21
Percents, multiplication, division, addition

A tip (also called a gratuity) is a payment made to certain service sector workers in addition to the price of the service. The amount of a tip is usually calculated as a percentage of the transaction value before taxes. Some of the people we tip are taxi drivers, waiters, hair dressers or barbers. Below are some guidelines for how much to tip:

- Hair dresser or barber:
- Food delivery:
- Waiter:
- Bartender:
- Taxi:

15\%
10\%
$15 \%-20 \%$ (depending on service)

$15 \%-20 \%$ (depending on service)
$15 \%$

Example: The Trey family went out for dinner. Their total bill before taxes came to $\$ 56.89$. They want to give a $15 \%$ tip.

Problem: How much should they tip the waiter? Round your answer to the nearest dollar.

Solution: Step 1: Convert 15\% into a decimal: . 15
Step 2: $\quad$ Multiply $\$ 56.89$ x $.15=\$ 8.53$
Step 3: Round off to nearest dollar: $\$ 9.00$
The Trey family should leave $\$ 9.00$ for their waiter.

Part 1: Finish filling in the following table. Remember that your tip should be calculated before taxes. Round to the nearest cent. The first one is done for you.

| Bill Pre-tax | Tip \% | Tip | Add GST <br> $(\mathbf{5 \%})$ | Total | Total bill <br> rounded to <br> nearest dollar |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1. $\$ 10.00$ | $15 \%$ | $\$ 1.50$ | $\$ .50$ | $\$ 12.00$ | $\$ 12.00$ |
| 2. $\$ 23.50$ | $20 \%$ | $\$ 4.70$ | $\$ 1.18$ | $\$ 29.38$ | $\$ 29.00$ |
| 3. $\$ 46.78$ | $15 \%$ | $\$ 7.02$ | $\$ 2.34$ | $\$ 56.14$ | $\$ 56.00$ |
| 4. $\$ 56.32$ | $20 \%$ | $\$ 11.26$ | $\$ 2.82$ | $\$ 70.40$ | $\$ 70.00$ |
| 5. $\$ 18.00$ | $15 \%$ | $\$ 2.70$ | $\$ .90$ | $\$ 21.60$ | $\$ 22.00$ |
| 6. $\$ 7.50$ | $15 \%$ | $\$ 1.13$ | $\$ .38$ | $\$ 9.01$ | $\$ 9.00$ |

Part 2: Calculate the tip for the following situations. Use the tipping guide below:

- Hair dresser or barber: 15\%
- Food delivery:

10\%

- Waiter:
$15 \%-20 \%$ (depending on service)
- Bartender:
$15 \%-20 \%$ (depending on service)

- Taxi: 15\%

1. Helen got her hair cut and coloured. It cost $\$ 105$ before taxes. How much should Helen leave as a tip? Round your answer to the nearest dollar.
2. Pat took a taxi to the hospital for an appointment. It cost $\$ 9.85$. How much should she give for a tip? Round your answer to the nearest 50 cents.

Consumer Math
3. Wayne ordered a pizza that cost $\$ 15.99$. How $\qquad$ much should he give the pizza delivery person? Round your answer to the nearest 50 cents.
4. The Campbells went out for dinner. Their bill came to $\$ 92.59$. How much money should they $\qquad$ leave all together assuming that they give a $20 \%$ tip? Round your answer to the nearest dollar.
5. Three co-workers went out for drinks after work. Lisa had a beer and it cost $\$ 7.50$. Jodi had a glass of wine and it cost $\$ 8.25$ and Sarah had a mixed drink that cost $\$ 8.00$. They had excellent service. How much should each person leave as a tip? How much would the bartender get altogether?
6. Jeff went out for lunch. His bill came to $\$ 22.50$ before taxes. He was not that pleased with the service so he decided to leave only a $10 \%$ tip. How much did he have to pay for lunch including GST (5\%) and tip? Round your answer to the nearest cent.

a $\qquad$
b $\qquad$
c $\qquad$
d $\qquad$
$\qquad$

## Short Cut to Tipping \#22

Estimation, rounding off

Not all of us carry calculators with us when we go out. Here is a quick way to calculate tips.

A short cut method for tabs of $\$ 30$ of more.

Example: Supper cost $\$ 45$.
Problem: How much tip should I leave?
Solution: Step 1: Take the dollar amount and drop the ones digit. (5)
Step 2: $\quad$ Double the number that is left. $(4 \times 2=8)$
$\$ 8$ is the amount you should leave. This is between $15 \%-20 \%$.

A short cut method for tabs $\$ 30$ or less.
This method produces a slightly higher percentage tip. Round your answers up to the nearest 5 or 10 .

Example: Lunch cost $\$ 17.20$
Problem: How much tip should I leave?
Solution: Step 1: $\quad$ Round $\$ 17.20$ up to 20.
Step 2: Double 20 - that's 40.
Step 3: Drop a zero - the tip is $\$ 4$.

## Consumer Math

Part 2: Calculate the tip using the short cut method from the previous page.

1. Lunch cost $\$ 29$.
2. Lunch costs $\$ 77$ for 4 people. How much should each person leave for a tip?
3. Breakfast was $\$ 12.95$. How much should I leave on the table including $\qquad$ the tip?
4. Supper cost $\$ 150$.
5. Supper cost $\$ 99$.
6. Two couples went for supper. The bill came to $\$ 145$. How much should each couple pay for a tip?
7. Three of us went for lunch. The bill came to $\$ 65$. How much should each of us leave for a tip?
8. I had a hotdog for $\$ 2.50$ and a coke for $\$ 2.00$. How much should I leave the vendor for a tip?

## The Cost of Eating Out \#23

## Multiplication, addition, percents, rounding off

Eating out can be costly. Calculate the total cost including GST and tip. GST is $5 \%$.

Example: The Smiths went out for supper. Their bill came to $\$ 89.90$ not including GST.

Problem: Calculate the total cost for supper including GST and tip (15\%). Round your answer to the nearest dollar.

Solution: Step 1: Convert $15 \%$ to a decimal then multiply $\$ 89.9 \times .15=\$ 13.49$
Step 2: $\quad$ Convert $5 \%$ to a decimal and then multiply $89.90 \times .05=\$ 4.50$
Step 3: $\quad$ Add $89.90+13.49+4.50=\$ 107.89$
Step 4: $\quad$ Round to nearest dollar $=\$ 108$
The total bill for the Smith family came to $\$ 108$ including tip and GST.

Directions: Fill in the following chart. The first one is done for you.

| Bill Pre-tax | GST (5\%) | Tip 15\% | Total | Rounded to <br> nearest dollar |
| :--- | :--- | :--- | :--- | :--- |
| $\$ 19.00$ | $\$ .95$ | $\$ 2.85$ | $\$ 22.80$ | $\$ 23.00$ |
| $\$ 28.50$ |  |  |  |  |
| $\$ 76.78$ |  |  |  |  |
| $\$ 96.32$ |  |  |  |  |
| $\$ 38.00$ |  |  |  |  |
| 12.50 |  |  |  |  |

## Vacation Travel \#24

## Multiplication, addition

Going on vacation can be very exciting however it can be very costly. It is a good idea to budget out your vacation before you go.

## Directions:

1. Calculate the cost for a family of 4 to go from Hay River to Edmonton to the Fantasy Land Hotel from May 12 - May 17. They arrive in Edmonton at noon and leave Edmonton at noon. Use the information below.

- Air travel from Hay River to Edmonton return for one person - \$459
- Hotel accommodation is $\$ 219$ per night plus GST (5\%) (1 Queen and 1 set of bunk beds)
- Meals for one day on average would be $\$ 125$
- Movies for one night - \$65
- Four West Edmonton Mall Attraction Passes for 2 days - \$160
- Taxis for the trip - $\$ 80$
- Shopping - \$350
a) Air travel
b) Hotel accommodation
c) Meals
d) Entertainment
e) Taxi and shopping
f) Total

2. Calculate the cost to go camping at Reid Lake for 5 nights.

- Gas one way - \$20
- Camping fees $-\$ 20$ per night
- Wood - $\$ 8.00$ per bundle - you will need 5 bundles
- Rent a canoe for the whole time - $\$ 30$ per day
- Rent a small RV - $\$ 100$ per day
- Food - $\$ 75$ per day

a) Gas
b) Camping fees
c) Wood
d) Canoe
e) $R V$
f) Food $\qquad$
g) Total $\qquad$

3. a) Which vacation is cheaper?
b) By how much?

## Taking Out a Personal Loan \#25

Percents, multiplication, subtractions
You can take out a personal loan from a bank or financial institution. Often car dealerships allow you to take out a loan to buy a vehicle. When you take out a loan you are charged interest. This is how banks and other financial institutions make their money.

## Example: Jill took out a $\$ 20,000$ loan for a new vehicle for 5 years with an annual interest rate of $5 \%$. Her monthly payments are $\$ 377.48$. <br> Problem: How much will Jill pay for her new vehicle overall? How much will she pay in interest?

Solution: First calculate how much she pays over 5 years or 60 months.
$60 \times \$ 377.48=\$ 22,648.80$
She pays $\$ 22,648.80$ for her new vehicle.
Next calculate how much interest she pays.
$\$ 22,648.80-\$ 20,000=\$ 2648.80$
She pays $\$ 2648.80$ in interest.

Directions: Solve the following problems.

1. Mike wants to purchase a 20 foot Lund fishing boat. It is on sale for $\$ 22,450$ at the local boat shop. They are offering financing for $9.5 \%$ over 5 years. Monthly payments are $\$ 471.61$.
a. How much will Mike pay for the boat overall? $\qquad$
b. How much does Mike pay in interest? $\qquad$
2. The Kudlaks want to buy a new snowmobile. They decide on a Yamaha. The price is $\$ 16,500$ at $8.5 \%$ interest rate over 6 years. Monthly payments are $\$ 293.41$.
a. How much will they pay for their snowmobile in total? $\qquad$
b. How much do they pay in interest? $\qquad$
3. Jennifer wants to buy a brand new car. She has really looked into models and prices and has decided to buy a hybrid. The vehicle costs $\$ 46,000$ at a 3\% interest rate over 6 years. Monthly payments
 are $\$ 699$ per month.
a. How much will Jennifer pay overall for her hybrid? $\qquad$
b. How much will she pay in interest? $\qquad$
4. Johnny wants to buy a new laptop computer. It will cost him a total of $\$ 3350$ after taxes and shipping. He will borrow this money from the bank at a $5 \%$ interest rate per year for three years. His monthly payments are $\$ 100.40$.
a. How much will Johnny pay for his loan overall? $\qquad$
b. How much interest does he pay? $\qquad$
5. Use the online personal loan calculator at http://www.tdcanadatrust.com/lending/tools/loan_calc.jsp and calculate the monthly payments for the following. You can use another online personal calculator but your answers may vary slightly.
a. $\$ 45,000$ loan at $4 \%$ for 6 years
b. $\$ 12,000$ loan at $7 \%$ for 3 years
c. $\$ 35,000$ loan at $5 \%$ for 5 years
d. $\$ 5000$ loan at $6.7 \%$ for 4 years
e. $\$ 4500$ loan at $8.5 \%$ for 3 years
6. Calculate the total cost and how much will be paid in interest for the previous question.
a. Total cost $\qquad$
b. Total cost $\qquad$
c. Total cost $\qquad$
d. Total cost $\qquad$
Interest paid $\qquad$

Interest paid $\qquad$

Interest paid $\qquad$

Interest paid $\qquad$
e. Total cost $\qquad$ Interest paid $\qquad$

## Discounts \#26

## Percents, multiplication, addition, subtraction

Often stores have sales and they give discounts off merchandise. Some stores even have store-wide discounts, like $15 \%$ off everything. Everyone likes a good sale!

Example: The local clothing store needs to make room for their summer stock so they put all their spring stock on sale for $25 \%$ off.
Problem: What is the discount on a pair of pants that cost $\$ 89$ ?
Solution: Convert $25 \%$ to a decimal $=.25$
$\$ 89.00 \times .25=\$ 22.25$
The discount is $\$ 22.25$ and the sale price is $\$ 89.00-\$ 22.25=\$ 66.765$.

Part 1: Calculate the sale discount and sale price of the items pictured.

|  | 38\% | \$ | \$ |
| :---: | :---: | :---: | :---: |
| ${ }^{7 .} \$ \$ 67$ | 25\% | \$ | \$ |
|  | 25\% | \$ | \$ |
|  | 20\% | \$ | \$ |
| 10. \$160 | 25\% | \$ | \$ |
| $\text { 11. 2\% }{ }^{2} \text { 䍂 } \$ 179$ | $75 \%$ | \$ | \$ |

Part 2: Solve the word problems below:
12. A store is having a store-wide sale. For one day only everything is $25 \%$ off. Calculate the cost of the following with the $25 \%$ discount:
a. A sweater regularly priced at $\$ 55$ will cost $\qquad$
b. Pants that are regularly priced at $\$ 99$ will cost $\qquad$
c. Shoes that are regularly priced at $\$ 129$ will cost $\qquad$
d. A skirt that is regularly priced at $\$ 46$ will cost $\qquad$
13. Another store is having a store-wide sale. On Monday everything in the store is $10 \%$ off, on Tuesday $20 \%$ off, on Wednesday $30 \%$ off, on Thursday $40 \%$ off and Friday 50\% off.
a. Josh goes on Monday and buys a pair of pants that were regularly $\$ 67$. What does he pay with his $10 \%$ discount? $\qquad$
b. How much would Josh have saved if he bought the same pair of pants on Friday? $\qquad$
c. Kerri bought a blouse for $\$ 32$, a skirt for $\$ 36$ and a sweater for $\$ 45$. What is her discount if she went on Wednesday? $\qquad$
d. How much did Kerri pay for her clothing? $\qquad$
e. How much would Kerri have saved if she went on Friday instead of Wednesday? $\qquad$
14. Sarah loves to shop and she loves bargains. She found a pair of jeans that originally cost $\$ 129$ and she only paid $\$ 77.40$. What discount did she get? $\qquad$
15. She also paid only $\$ 28$ for a pair of shoes that originally cost $\$ 70$. What discount did she get? $\qquad$

## Installment Buying \#27

Percent, multiplication, addition, subtraction
Installment buying is when you pay for a portion of your purchase immediately and have the remaining balance owing divided into equal payments.

Installment buying is usually more expensive than just buying the item outright. The company needs to make some extra money to cover administration fees and interest lost on their money.

Example: Bracks Fine Furniture sells a fridge for $\$ 900$ plus taxes if you pay now. If you wish, you can buy the fridge on installments for $\$ 300$ down and $\$ 135$ a month for 6 months (this plan already includes taxes).

Problem 1: What is the difference in cost between the normal price and the installment price?

Solution: Step 1: If you purchase the fridge now, it will cost you the purchase price plus taxes:
$\$ 900 \times 0.05=\$ 45.00$ GST
$\$ 900+\$ 45=\$ 945-$ purchase up front
Step 2: If it is purchased with installments it would cost:
$\$ 300$ for the down payment
$\$ 135 \times 6$ for the six months of payments $=\$ 810$
$\$ 300+\$ 810=\$ 1110.00$
\$1110 - \$945 (purchase up front) = \$165
You would pay $\$ 165$ more by buying through an installment plan.

Directions: Calculate the following installment payment problems.

1. Steve wants to buy a new plasma TV. He can buy it now for $\$ 5800$ plus $5 \%$ GST, or he can pay in installments by paying $\$ 1000$ down and $\$ 250$ a month for 24 months (taxes are already included in the installment plan).

a. How much would the TV be if he paid directly including GST?
b. How much would the TV be if he paid in installments?
c. How much does Steve owe after his down payment?
$\qquad$
d. What is the difference in price between buying the TV directly and paying in installments? $\qquad$
2. Lisa wants to buy new furniture for her living room. She can buy it now for $\$ 7600$ plus $5 \%$ GST, or she can pay in installments by paying $\$ 500$ down and $\$ 345$ a month for two years (taxes are included in the installment plan).
a. How much would the furniture be if she paid directly including GST? $\qquad$
b. How much would the furniture be if she paid in installments?
$\qquad$
c. How much does Lisa owe after her down payment?
$\qquad$
d. What is the difference in price between buying the furniture directly and paying in installments? $\qquad$

Consumer Math
3. Susan wants to buy all new kitchen appliances. She can't afford to pay for them directly, so she is going to pay in installments for 2 years. The new kitchen appliances cost $\$ 8200$ plus GST. She is required to pay $\$ 700$ up front and the GST. Then she has to pay $\$ 350$ per month for 2 years.
a. How much would the new kitchen appliances be if she
 paid directly including GST? $\qquad$
b. How much does Susan owe after her down payment?
c. How much would the appliances be if she paid in installments?
d. What is the difference in price between buying the appliances directly and paying in installments? $\qquad$

## Cell Phones \#28

## Addition, multiplication, reading charts, problem solving

If you have a cell phone you know that they can be very expensive. There are many hidden costs. Below is some information about 4 separate plans you can get.

| Plan 1 - \$25/month | Plan 2 - \$30/month | Plan 3 - \$35/month | Plan 4 - \$45/month |
| :---: | :---: | :---: | :---: |
| Up to 100 minutes and 50 bonus minutes | Up to 150 minutes and 50 bonus minutes | Up to 250 minutes | Up to 450 minutes |
| Pick one bonus feature: <br> - 500 incoming minutes <br> - Extended hours ( $6 \mathrm{pm}-7 \mathrm{am}$ ) | Pick one bonus feature: <br> - 500 incoming minutes <br> - Extended hours (6pm - 7 am) | Pick one bonus feature: <br> - Unlimited incoming calls <br> - Extended hours (5pm - 7 am) | Pick one bonus feature: <br> - Unlimited incoming calls <br> - Extended hours (5pm - 7 am) |
| Unlimited Nights - 9 pm - 7 am and unlimited weekends for all plans |  |  |  |
|  | Call waiting and Additional minutes f Additional text Canadian long distan | conference calling all plans - 35 $\phi /$ minu essages - $35 \phi$ each minutes $-35 \phi /$ minu |  |

## Additional Charges

- \$35 connection fee on your first bill
- \$6.95 system access fee each month
- 75 \& for 911 service each month (even though we don't have 911 in NWT)

## Additional Options

A. $\mathbf{\$ 1 0}$ - call display, 100 sent and unlimited received text messages
B. $\$ 15$ - call display, 200 sent text, picture and video messages and unlimited received text messages
C. $\$ 20$ - call display, unlimited sent and received text, picture and video messages

Consumer Math
Directions: Using the information on the previous page. Answer the questions below.

1. David uses his cell phone a lot for phoning and texting.
a. What plan would be best for him? $\qquad$

b. What bonus feature do you think he should pick? $\qquad$
c. What additional option should he choose? $\qquad$
d. How much will his monthly plan be (including additional charges)?
$\qquad$
e. How much will he pay altogether for his first month of service?
$\qquad$
2. I would like to get 250 minutes free, unlimited incoming calls, unlimited weekends and nights, call waiting, call display and unlimited text messages.
a. How much will my monthly charges be each month including additional charges but not including extra minutes?. $\qquad$
b. How much extra will I pay for the first month of service? $\qquad$
c. How much more will I pay altogether if I end up using 400 minutes of time?
$\qquad$
3. Susan wants a cell phone for emergencies and safety reasons. She doesn't think she will use it much.
a. What plan would be best for her? $\qquad$
b. How much will her monthly charges be including additional charges?
$\qquad$
c. How much will she pay for her first month of charges? $\qquad$
d. How much would she pay extra if she used 250 minutes per month?
4. Will chose Plan 2 and Option A.
a. How much will he pay each month including additional charges?

b. Will underestimated his text message usage. In his first month he actually sent 300 text messages. How much extra did this cost him?
c. He also underestimated the number of minutes he would use on his cell phone. He ended up using 350 minutes for the month (outside of weekends and evenings). How much extra did this cost him? $\qquad$
d. What plan would be best for him? $\qquad$
e. What additional options would be best for him? $\qquad$
5. Helen chose Plan 3 and Option B.
a. How much will her first month's bill be including additional charges? $\qquad$
b. How much will her monthly bills be after that?
$\qquad$
c. How much more would she have to pay if she uses 300
 minutes of time? $\qquad$
d. How much more would she have to pay if she sent 200 text messages?
$\qquad$
6. What plan would you choose? $\qquad$ Why?

Consumer Math

## Fuel Consumption \#29

Multiplication, division, problem solving, using the metric system

Gas prices have been on the rise for many years. In the summer of 2008 they were at their highest. Some places paid $\$ 1.21 / \mathrm{L}$ while others paid $\$ 1.50 / \mathrm{L}$. In this activity we are going to compare fuel consumption of
 vehicles, and cost out trips. Fuel consumption is always calculated by litres per 100 km in Canada.

Example: The Campbell family is driving from Edmonton to Yellowknife. The cost of gas in Yellowknife is $\$ 1.01 / \mathrm{L}$. Gas gets cheaper as you drive south but for this activity we will use the Yellowknife gas prices. The
 van that the Campbells are travelling in uses $10 \mathrm{~L} / 100$ km . The distance between Yellowknife and Edmonton is 1600 km .

Problem: How much will it cost in gas for the Campbell family to go from Yellowknife to Edmonton?

Solution: Step 1: Calculate how many litres you will need.
Divide $1600 \mathrm{~km} \div 100 \mathrm{~km}=18$
Multiply $18 \times 10 \mathrm{~L}=180 \mathrm{~L}$

Step 2: Calculate how much it will cost.
Multiply $180 \mathrm{~L} x \$ 1.01=\$ 181.50$
It will cost the Campbell family $\$ 181.80$ to go to Edmonton one way.

Directions: Look at the chart and answer the questions below.

| Vehicle (all 2009) | Highway per 100 km | City per 100 km |
| :--- | :---: | :---: |
| Ford Ranger Pick-up (4WD) | 12.4 L | 15.7 L |
| Ford Escape (4WD) | 9.4 L | 12.4 L |
| Ford Focus | 6.7 L | 9.8 L |
| Dodge Caravan | 9.4 L | 13.8 L |
| Dodge Caliber | 7.8 L | 9.8 L |
| Sierra GMC (4WD) | 11.8 L | 16.8 L |
| Hummer SUV | 14.7 L | 18.1 L |
| Smart Car | 3.9 L | 4.6 L |

1. Which vehicle has the worst fuel consumption overall? $\qquad$
2. Which vehicle has the best fuel consumption overall? $\qquad$
3. You travel 300 km in a Ford Focus. Gas costs $\$ 1.01 / \mathrm{L}$.
a. How many litres of gas would you use in the city? $\qquad$
b. How much would it cost? $\qquad$
c. How many litres of gas would you use on the highway?
$\qquad$
d. How much would it cost (round to the nearest cent)? $\qquad$
e. What is the difference in cost? $\qquad$

## Consumer Math

4. You travel 300 km in a Smart Car. Gas costs $\$ 1.01 / \mathrm{L}$
a. How many litres of gas would you use in the city? $\qquad$
b. How much would it cost? $\qquad$
c. How many litres of gas would you use on the highway? $\qquad$
d. How much would it cost? $\qquad$
e. What is the difference in cost? $\qquad$
5. You travel 300 km in a Hummer. Gas costs $\$ 1.01 / \mathrm{L}$.
a. How many litres of gas would you use in the city?

b. How much would it cost? $\qquad$
c. How many litres of gas would you use on the highway?
d. How much would it cost? $\qquad$
e. What is the difference in cost? $\qquad$
6. Compare your results from \#3, 4 and 5 .
a. How much more does it cost to travel in a Hummer than a Smart Car on the highway for 300 km ? $\qquad$
b. How much more does it cost to travel in a Ford Focus than a Smart Car on the highway for 300 km ? $\qquad$
c. How much more does it cost to travel in a Hummer than a Ford Focus on the highway for 300 km ? $\qquad$
7. How much more would it cost you to travel from Yellowknife to Edmonton in a Hummer verses a Ford Focus if gas cost \$1.04/L. Yellowknife to Edmonton is 1600 km . $\qquad$
8. You are going from Yellowknife to Edmonton in a 2009 Dodge Caravan. The trip is 1600 km . How much will it cost you to get there if the price of gas is $\$ 1.10 / \mathrm{L}$ ?

9. You are going on a big trip with your family. You are moving from Inuvik to Yellowknife. Gas costs are different in different places. You are travelling in a 2009 Ford Escape.
 Answer the questions below to find out how much it will cost you in gas. Round your answers to the nearest cent.
a. How much does it cost for your first leg of the trip from Inuvik to Whitehorse. It is 1226 km and gas costs \$1.19/L. $\qquad$
b. When you get to Whitehorse you decide to do a daytrip to Skagway, Alaska. It is 180 km (one way) on the highway and gas costs $\$ 1.05 / \mathrm{L}$.
c. You stay in Whitehorse for a couple of days. You drive 100 km around the city. Gas costs $\$ 1.05 / \mathrm{L}$. $\qquad$
d. You drive from Whitehorse to Yellowknife on the highway. Gas costs on average $\$ 1.07 / \mathrm{L}$. It is 2704 km . $\qquad$
e. How much in total did you spend for gas? $\qquad$
f. Now do the same thing for a Dodge Caliber. How much money do you save if you travel in a Dodge Caliber? $\qquad$

# Finding Fuel Consumption \#30 

Multiplication, division, decimals

## Calculate Your Own Fuel Consumption

You need to learn how to calculate your own fuel consumption. Don't take anyone's word for it. Especially, do not rely on the manufacturer's estimate. This is a number that is used to sell cars, not to save gas. They use professional drivers on closed courses. You will never get the same gas usage unless you are coasting down a hill. Use the manufacturer's number to compare different models of cars, but don't think it will help you determine how much gas you will end up putting in your car.

## The Simple Gas Consumption Test

The first thing you need to do is drive until your tank is empty. When you get low, just drive near a gas station until the low fuel indicator has been on for some time, and you are quite sure there are just a few drops left. If you do not have a dashboard indicator which tells you how many miles you have left, make sure to bring a full gas can in case you run out on the road. When your tank is empty, fill it up and write down the number of litres your tank holds.

## How to Calculate Your Fuel Consumption

Now, reset your trip odometer and drive normally. Obey all speed limits and do not load the car with anything that you don't always take with you. When your tank is empty again, note how many kilometres you have driven. Divide the kilometres you have driven by the number of litres that your tank holds and then multiply by 100 and you will have your baseline gas in litres/100 km.

Example: You filled up your tank and zeroed the trip odometer. Next time you are at the gas station, your trip odometer shows 480 km and it took 42 litres to fill up the tank again. That means your car consumed 42 litres to drive 470 kilometres.

Problem: What is your fuel consumption or fuel economy?
Solution: $42 \mathrm{~L} \times 100 \div 470 \mathrm{Km}=8.9 \mathrm{~L} / 100 \mathrm{~km}$
The fuel consumption for your vehicle is $8.9 \mathrm{~L} / 100 \mathrm{~km}$.

Directions: Calculate the fuel consumption for the following problems. Fuel consumption is measured in $\mathrm{L} / 100 \mathrm{Km}$.

1. Rick and his family drove from Yellowknife to Hay River for the May long weekend. The odometer read 22,320 kilometres at the beginning of the trip, and 23,220 kilometres at the end. They used 75 litres of gas to travel that distance. On the window sticker of their new car, the gas consumption rating is $7.5 \mathrm{~L} / 100 \mathrm{~km}$ on the highway. Round your answers to the first decimal point.
a. What is the estimated fuel consumption of their car for this trip?
$\qquad$
b. How does it compare to the gas consumption rating?
2. Mike wanted to figure out the gas consumption in the city of his truck. He made sure the tank was close to empty and then he filled it up. The odometer read 45,600 when he filled it up and read 46,056 when it was empty again. He has an 80 L tank. The cost of fuel is $\$ .99$ per $L$.
a. What is Mike's estimated fuel consumption for his truck in $\mathrm{L} / 100 \mathrm{~km}$ ?
$\qquad$
b. How much does it cost Mike to fill his tank at the listed gas price?
c. Mike usually drives at least 250 km per week. How much would this cost him? (you will need to do a ratio)

Consumer Math
3. Dora travels from Fort Providence to Yellowknife twice a month for meetings. The distance between Fort Providence and Yellowknife is 300 km . Gas prices are usually around $\$ 1.10 / \mathrm{L}$. She has an 80 L tank. She uses 45 L for a one way trip.
a. What is Dora's gas consumption for one trip?
b. How much money does it cost Dora for one trip?
$\qquad$
c. How much does it cost Dora each month? $\qquad$
d. How much does it cost Dora to fill up? $\qquad$
e. Should Dora fill up again in Yellowknife for her trip home?
$\qquad$
4. The bus costs $\$ 90$ return from Fort Providence to Yellowknife.
a. Would it be cheaper for Dora to take the bus? $\qquad$
b. What is the difference in price? $\qquad$
c. Sometimes Dora travels with a friend and they share expenses. How much would it her cost her then for one trip? $\qquad$

## Renting a Vehicle \#31

Multiplication, division, addition, subtraction
Sometimes we find ourselves in the position where we need to rent a vehicle for travelling. Often rental companies have different deals and plans. Look at the chart below.

Which rental plan you should choose depends on how far you will go during the trip. The math concept that will help you make the choice is called the breakeven analysis. Below is a table for the rental cost.

| Model | Standard Daily <br> Rate (Dollars) | Plus Cents Per <br> Kilometre | Unlimited Mileage Daily <br> (Dollars) |
| :---: | :---: | :---: | :---: |
| Sub-Compact | 40 | 15 | 70 |
| Compact | 45 | 21 | 75 |
| Midsize | 49 | 23 | 80 |
| Station Wagon | 55 | 25 | 89 |
| Van | 64 | 28 | 100 |
| Luxury | 70 | 30 | 105 |

Example: Susie and her family rent a vehicle to go to Behchokè for the day. It is about 100 km to Behchokę one way. There are five of them travelling so they will need a van.

Problem: Should they get the Standard Daily Rate or Unlimted Mileage Daily?
Solution: $200 \mathrm{~km} \times .28=\$ 56$ for kilometres travelled
\$56 + \$64 (Standard Daily Rate) = \$120
Susie and her family should get the Unlimited Mileage Daily plan as it would only cost them $\$ 100$ compared to $\$ 120$ for the Standard Daily Rate plus mileage.

Consumer Math

Directions: Use the chart on the previous page to answer the problems below.

1. Michelle and her family are going on a vacation trip. The total driving distance is 1700 kilometres and the trip will last one week (7 days). They need to rent a mid-size car.

a. How much would it cost them to rent the vehicle through the Standard Daily Rate plus Mileage plan? $\qquad$
b. How much would it cost them to rent the vehicle through the Unlimited Mileage plan? $\qquad$
c. What is the better plan? $\qquad$
d. How much money will this save them? $\qquad$
2. The Jones family is flying to Edmonton and then renting a luxury car to travel to Banff. A one way trip is 300 km and they will most likely put on another 200 km driving around town. They need to rent the vehicle for 6 days.
a. How much will it cost them if they use the Standard Daily Rate plus Mileage? $\qquad$
b. How much will it cost them if they use the Unlimited Mileage plan?
c. What is the better plan? $\qquad$
d. How much money will it save them? $\qquad$
3. Louise needs to rent a small car in Yellowknife. She just needs it for getting around town while she is here. She is in Yellowknife for 5 days and will probably drive about 25 kilometres per day.
a. How much will it cost them if they use the Standard Daily Rate plus Mileage? $\qquad$
b. How much will it cost her if she uses the Unlimited Mileage plan?
c. Which is the better plan? $\qquad$
d. How much money will it save her? $\qquad$
4. The Baker family rented a station wagon for 10 days to travel from Edmonton to Yellowknife to visit family. It is 1600 km one way from Edmonton to Yellowknife.
a. How much will it cost them if they use the Standard Daily Rate plus Mileage? $\qquad$
b. How much will it cost them if they use the Unlimited Mileage plan?
c. Which is the better plan? $\qquad$
d. How much money will it save them? $\qquad$

Consumer Math
Consumer Math Review \#32

1. How much would you tip a server who gave you excellent service if your bill was $\$ 45$ ? $\qquad$
2. You go out to eat and your bill comes to $\$ 123$. The GST is $5 \%$ and you leave a $15 \%$ tip. How much would it cost altogether? $\qquad$
3. Jill takes a loan out for $\$ 15,000$ for a car over 5 years at a $5 \%$ interest rate. Her monthly payments are $\$ 283.11$.
a. How much does Jill pay overall for her car? $\qquad$
b. How much does she pay in interest? $\qquad$
4. Jane loves to shop. She finds a store that has a $15 \%$ discount on all items. And some items have an additional discount. Calculate the cost for each item:

| Item/Cost | Store Discount | Additional <br> Discount | Cost with <br> Discount |
| :--- | :--- | :--- | :--- |
| Jeans $\$ 85$ | $15 \%$ | $15 \%$ |  |
| Sweater $\$ 45$ | $15 \%$ | $20 \%$ |  |
| Jacket $\$ 145$ | $15 \%$ | $25 \%$ |  |
| Boots $\$ 175$ | $15 \%$ | $45 \%$ |  |
| Blouse $\$ 30$ | $15 \%$ | $10 \%$ |  |

a. How much money did Jane spend altogether? $\qquad$
b. How much money did Jane save? $\qquad$
5. Another store is having a store-wide sale. On Monday everything in the store is $15 \%$ off, on Tuesday $20 \%$ off, on Wednesday $25 \%$ off, on Thursday $30 \%$ off and Friday $50 \%$ off.
a. Joe goes on Monday and buys a pair of pants that were regularly $\$ 45.00$. What does he pay for the pants? $\qquad$
b. How much would Joe have saved if he bought the same pair of pants on Friday? $\qquad$
c. Susan bought a blouse for $\$ 32$, a skirt for $\$ 46$ and a sweater for $\$ 55$. What is her discount if she went on Wednesday? $\qquad$
d. How much did Susan pay for her clothing? $\qquad$
e. How much would Susan have saved if she went on Friday instead of Wednesday? $\qquad$
6. Lee really wants a cell phone but wonders if it is too expensive. He decides to get the cheapest plan that costs $\$ 27.50$ per month. He has 150 minutes free. Additional minutes are $35 \phi$ each. He ends up using the phone way more than he expected. He ends up using 400 minutes in total. How much extra does Lee have to pay?
7. You travel 300 km in a Sierra GMC 4 WD truck. Gas costs $\$ 1.01 / \mathrm{L}$. The gas mileage for this truck is $11.8 \mathrm{~L} / 100 \mathrm{~km}$ on the highway and $16.81 \mathrm{~L} / 100 \mathrm{~km}$ in the city.
a. How many litres of gas would you use in the city? $\qquad$
b. How much would it cost? $\qquad$
c. How many litres of gas would you use on the highway? $\qquad$
d. How much would it cost (round to the nearest cent)? $\qquad$
e. What is the difference in cost? $\qquad$

Consumer Math
8. Paul wants to figure out the fuel consumption of his new SUV in the city. He made sure the tank was close to empty and then he filled it up. The odometer read 5,600 when he filled it up and read 6,096 when he was empty again. He has a 75 L tank. The cost of fuel is $\$ .97$ per L .
a. What is Paul's estimated fuel consumption for his SUV in $\mathrm{L} / 100 \mathrm{~km}$ ?
b. How much does it cost Paul to fill his tank at the listed gas price?
c. Paul usually drives at least 350 km per week. How much would this cost him? (you will need to do a ratio)

| Model | Standard Daily <br> Rate (Dollars) | Plus Cents Per <br> Kilometre (mileage) | Unlimited Mileage <br> Daily (Dollars) |
| :---: | :---: | :---: | :---: |
| Sub-Compact | 40 | 15 | 70 |
| Midsize | 49 | 23 | 80 |
| Van | 64 | 28 | 100 |
| Luxury | 70 | 30 | 105 |

9. Lynn rents a luxury car at the Edmonton International Airport. She wants a nice vehicle for her 3 day trip. She figures she will put on about 400 km during the three days.
a. What would be the cost of the Standard Daily Rate plus Mileage plan?
b. What would be the cost of the Unlimited Mileage plan?
c. Which is the better plan? $\qquad$

## Consumer Math Projects

1. Organize a fictional trip for your family. Choose a really nice place like Disney Land or Cuba. Research on the Internet how much it would cost. Calculate how much your trip will cost in total.
2. Organize a trip for your class. Choose a destination and calculate the costs for your class to go on a trip there. Come up with a plan for raising money for your trip.
3. Compare prices for renting a vehicle from two different rental companies. Present your findings to your class.
4. Do a research project on hybrid vehicles. Compare the costs for gas for a hybrid vehicle versus a regular vehicle that only uses gas. Choose vehicles that are similar in size. Hybrid vehicles are often more expensive than vehicles that consume only gas. Figure out how long it will take to get your money back through money you have saved on gas.
